Senior Software Engineer | Full-Stack & AI Engineering

Value Proposition

My Contribution

I bring more than 15 years of software engineering experience and the ability to take solutions from architecture to production. At Julius Baer, while employed by Fintama, I owned five business-critical microservices, managed five developers and delivered Java backend and React frontend features. I helped reduce application operating costs by 40%, measured through operational bills, and supported applications serving approximately 10,000 users. Working at Fintama gave me experience in a startup environment, adapting quickly across development, business analysis, testing and deployment support. Through Findipend, my independent AI product, I also bring hands-on ownership of a React frontend, Python and TypeScript backend components, and AWS deployment. I combine this delivery experience with mentoring, collaboration and practical engineering standards to help a growing team produce useful, reliable software.

My Profile

- Startup experience at Fintama, contributing across roles and initiating an internal knowledge-base chat prototype.
- End-to-end ownership across Java, Python, React, TypeScript, JavaScript, AWS and Kubernetes.
- Technical leadership and people management for five developers, including onboarding and mentoring.
- Engineering practices: Pair Programming, Code Reviews, Unit Tests, Integration Tests and Static Code Analysis.
- Scrum delivery, Version Control (Git), and CI / CD Build Server workflows using Jenkins and GitHub Actions.
- Collaboration with business analysts, end users and testers to clarify needs and support delivery.
- Used Jira and ClickUp for Time Tracking, recording time spent on tasks and project work.
- Performance optimization, autoscaling and Kafka-based event-driven systems in banking production.

Business Experience

Creator & Full-Stack Developer — Findipend and Independent AI Projects

2025 – today | *Independent project, separate from Fintama employment*

- Independently designed and built Findipend, a publicly available AI application for portfolio analysis and management, currently under active development with a long-term SaaS vision.
- Built live React dashboards using TanStack Query and Redux, implementing the complete flow from frontend and APIs to backend processing and deployment.
- Implemented Python and TypeScript backend components, owning development across the full application stack.
- Built end-to-end retrieval-augmented generation (RAG) pipelines and multi-agent orchestration with CLI tools and Model Context Protocol (MCP) integrations.
- Deployed Findipend on Kubernetes (K3s) running on Amazon EC2, using Amazon ECR, Amazon RDS, Amazon SNS and Amazon Bedrock.
- Applied agentic coding workflows with Claude Code and Codex to support implementation and iteration.

Senior Software Engineer / Lead Developer — Fintama AG

2022 – 2025 | *Client assignment: Julius Baer*

Julius Baer client delivery

- Owned five business-critical microservices end-to-end, from solution design and implementation to deployment, maintenance and production support.
- Managed five developers and led technical work and delivery, aligning priorities and resolving blockers.

- Delivered end-to-end Java backend and React frontend features when frontend developers were unavailable, using JavaScript in frontend development.
- Collaborated with the Kubernetes infrastructure team to optimize production resource utilization, reducing application operating costs by 40%, measured through operational bills.
- Implemented autoscaling for variable traffic across Singapore and the USA, supporting approximately 10,000 users as observed in application logs.
- Designed REST APIs and Kafka event-driven integrations with Avro schemas between Spring Boot and WildFly microservices.
- Created a Spring Boot starter library for per-consumer Kafka dead-letter monitoring, adopted by other teams to establish consistent failure-handling behaviour across the department.
- Served as a Kafka specialist for a unit of approximately 50 people, investigating missing events and real-time streaming issues across teams.
- Investigated transactional event processing and producer/consumer database inconsistencies; supported schema management, secure topic access and SSL certificate renewal.
- Provided technical leadership in microservice architecture and engineering best practices through Pair Programming and Code Reviews.
- Championed TDD with JUnit and Mockito Unit Tests and Testcontainers Integration Tests, supporting the bank's mandatory 80%+ test coverage requirement.
- Used Static Code Analysis in CI/CD pipelines with PMD, Checkstyle, ESLint, Semgrep and SonarQube.
- Maintained CI / CD Build Server workflows with Jenkins and GitHub Actions, using Gradle and shell scripts for builds and deployments.
- Used Version Control (Git) for source changes and collaborative delivery.
- Took ownership of migrating component project structures to an Nx monorepo, adapting the codebase to evolving bank standards.
- Prepared and managed production deployments every two weeks within banking release governance.
- Participated in Scrum ceremonies, including daily stand-ups, sprint planning, reviews and retrospectives.
- Onboarded and mentored developers through knowledge sharing and collaborative problem-solving.
- Worked across development and testing responsibilities, supporting testers with requirement clarification and issue investigation.
- Engaged end users in formal and informal discussions to translate user and business needs into product features.
- Led sessions with business analysts to improve user stories and acceptance criteria through a consistent story structure.
- Used Grafana dashboards and Kibana log analysis to investigate failures and performance issues.

Fintama internal startup contributions

- Worked flexibly across development, business analysis, testing and production deployment support, adapting to rapid context switches and project needs.
- Initiated and built an internal knowledge-base chat prototype, including a web scraper and text vectorization, alongside client responsibilities.

Senior Software Engineer / Team Lead — EPAM

2020 – 2021 | *Client: Broadridge, USA*

- Led a six-person development team and served as the technical contact between the customer, business analysts and developers.
- Facilitated Scrum ceremonies, including daily stand-ups, sprint planning, reviews, demos and retrospectives, within two-week sprints.
- Clarified user stories and acceptance criteria with business analysts to prepare work for implementation.
- Broke complex initiatives into epics and sprints, coordinating dependencies and resolving delivery blockers.
- Collaborated with solution architects to align implementation with evolving business requirements.
- Implemented dynamic Spring configuration updates so application settings could refresh without a service restart.

Senior Backend Engineer / Key Developer — EPAM

2016 – 2019 | *Client: Verimi*

- Led authentication and authorization implementation across approximately 20 Spring Boot microservices using Spring Security and OAuth 2.0.
- Implemented custom components within the Spring Security filter chain and built an OAuth testing framework.
- Secured APIs and service communication through TLS/HTTPS, encryption, CORS policies and CSRF protection.
- Contributed to cloud architecture and CQRS design, evaluating Java backend components for scalability and maintainability.

Java Backend Developer — UBS Client Assignment

2010 – 2016

- Developed Java backend features and resolved complex production issues in business-critical banking applications.
- Implemented Oracle PL/SQL packages, stored procedures and functions.
- Optimized performance-sensitive queries and maintained complex database logic.
- Delivered technical design, implementation, testing, deployment and production support across the software lifecycle.

Core Skills

Languages and frontend: Java, Python, TypeScript, JavaScript, React, TanStack Query, Redux, Nx.

Backend and integration: Spring Boot, Spring Security, OAuth 2.0, REST APIs, Kafka, Avro, event-driven systems.

AI: RAG, agent frameworks, MCP, model integrations, Amazon Bedrock.

Cloud and delivery: AWS, Kubernetes, Docker, K3s, Amazon EC2, Amazon ECR, Amazon RDS, Amazon SNS, Jenkins, GitHub Actions, Gradle, Git.

Quality and collaboration: Pair Programming, Code Reviews, Unit Tests, Integration Tests, Static Code Analysis, TDD, Scrum, Time Tracking (Jira, ClickUp), collaboration with testers; PMD, Checkstyle, ESLint, Semgrep and SonarQube.

Operations: Grafana, Kibana, autoscaling, incident investigation and production deployment support.

Professional Development

- AWS Certified Solutions Architect – Associate — completed.
- Professional Certificate in AI & Machine Learning — completed.
- LangChain / LangGraph Academy — completed.
- Agentic AI, Johns Hopkins University — in progress.

Education

- 2004 – 2010 · Information Technology – Software Engineering, Technical University of Budapest

Languages

- Hungarian — native.
- English — professional working proficiency.
- German — A1–A2, actively improving.
