Senior Backend & AI Engineer

Value Proposition

My Contribution

With more than 15 years of building and operating production backend systems, most recently 5 business-critical microservices in Swiss private banking, I can build and run the platform components that let Axpo use AI in a governed way. I have built LLM systems with model routing across Anthropic and OpenAI tiers, a provider-agnostic agent framework with pluggable backends (including local Ollama models) and a public MCP server. That means I can contribute directly to LLM routing across providers, an MCP tool registry and the evaluation of alternative model options. I designed authentication, authorization and secure service-to-service communication across about 20 Spring Boot microservices. I can bring that identity, permission and hardening discipline to an AI platform. My deployment experience covers Kubernetes, Helm, Terraform and GitHub Actions/Jenkins pipelines under strict banking release governance, plus Grafana and Kibana observability, which I can use to build a reliable path from repository to running application. I also write architecture decisions down, set standards that other teams adopt and work across product, architecture and business stakeholders, so the people who build on the platform get clear documentation and responsive support.

My Profile

- 15+ years building and operating production backend systems, including end-to-end ownership of 5 business-critical microservices in a regulated banking environment
- Hands-on LLM engineering in Python and TypeScript: model routing across Claude and OpenAI tiers, structured extraction, streaming, RAG, and pluggable providers (Anthropic, OpenAI, Ollama)
- Agent and tool infrastructure: built a public MCP server, a LangGraph multi-agent system, an own agent framework and a Python rewrite of the Goose agent core
- Identity, permissions and hardening: Spring Security and OAuth 2.0 across ~20 microservices, plus TLS, CORS, CSRF and secure API access
- Platform delivery: Kubernetes, Helm, Terraform, CI/CD with GitHub Actions and Jenkins, and observability with Grafana and Kibana
- Ownership and standard-setting: introduced a DLQ pattern adopted by a 50–60-person unit, championed TDD for 80%+ coverage and publish architecture decisions as case studies

Business Experience

AI Engineer – LLM Systems & Agent Infrastructure — Independent Projects

07/25 – today

- Built a provider-agnostic agentic framework in Python with a reason-plan-act-observe loop, dynamic tool injection, automatic context summarization and SQLite persistence, and re-engineered the Goose agent core in five Python modules backed by a full pytest suite.
- Deployed own AI systems on Kubernetes with Helm charts, Terraform infrastructure as code and GitHub Actions CI/CD, taking them from repository to running service.
- Built 5 production-style systems on the Anthropic Claude and OpenAI APIs in Python and TypeScript, applying model routing across model tiers, structured extraction, extended/adaptive thinking and streaming.
- Designed model routing across provider tiers and pluggable LLM backends (Anthropic, OpenAI, Ollama), making the choice of provider and model per request explicit and controllable.

- Built Model Context Protocol (MCP) servers that connect agents to real tools and data sources, including a public server giving any LLM agent access to 20+ technical indicators through one API.
- Designed and built findipend.com, a LangGraph multi-agent system for crypto asset analysis, and re-implemented the Rust orchestration core of the open-source Goose agent as minigoose in Python.

Lead Developer / Backend Platform Owner — Fintama AG

06/22 – 07/25 | *Customer: Julius Baer*

- Owned 5 business-critical microservices in private banking production serving ~10K users from Singapore to the USA. Introduced auto-scaling and, with the production Kubernetes team, cut resource consumption and operating cost by 40%. Added Kafka dead-letter monitoring that brought failed-event production tickets down to nearly zero.
- Designed REST APIs and Kafka event-driven integrations with Avro schemas between Spring Boot and WildFly microservices, and helped set cross-team API contracts and integration standards in quarterly architecture sessions.
- Maintained Kubernetes-based environments for 5 business-critical microservices, supporting reliable deployments within strict banking release governance.
- Ran CI/CD pipelines with GitHub Actions, Jenkins, Gradle and shell scripting, and built Grafana dashboards and Kibana log analysis that helped find application failures and their root causes faster.
- Delivered front-to-back stories in React, including dashboard filters and user actions, when frontend capacity was short, and built an OpenAPI-based stub backend that let the frontend team work in parallel with backend implementation.
- Led 5 developers and coordinated delivery across 3 teams, working with solution architects to turn changing business requirements into scalable solutions with clear visibility into priorities and dependencies.
- Championed Test-Driven Development across a 5-developer team with JUnit, Mockito and Testcontainers, so the team consistently met the bank's mandatory 80%+ coverage requirement.
- Azure based Kubernetes cluster

Team Lead / Backend Engineer — EPAM

11/20 – 10/21 | *Customer: Broadridge (USA)*

- Served as primary technical contact between a US-based customer, business analysts and a 6-person team, turning business needs into user stories with clear acceptance criteria and running regular stakeholder demos.

Senior Backend Engineer – Application Security & Identity — EPAM

12/16 – 11/19 | *Customer: Verimi*

- Secured APIs and service-to-service communication with TLS/HTTPS, encryption at rest, CORS policies and CSRF protection to protect sensitive identity dataRFGEGERGTR
- Led the design and implementation of authentication and authorization across about 20 Spring Boot microservices with Spring Security and OAuth 2.0, creating one consistent model for who may access which service.

Java Backend Developer

04/10 – 12/16 | *Customer: UBS*

- Consistently delivered assigned development tasks and new features using Java, Spring, and Oracle, meeting project requirements and agreed timelines.
- Developed and maintained complex Oracle PL/SQL packages, stored procedures, and functions, supporting business-critical application logic and database operations.
- Contributed to the full software development lifecycle, including implementation, testing, bug fixing, deployment, and production support.

Core Skills

Python · Large Language Models (LLMs) – Anthropic Claude, OpenAI · Model Context Protocol (MCP) · Agent Frameworks (LangGraph) · Retrieval-Augmented Generation (RAG) · Kubernetes (K8s) · CI/CD Pipelines (GitHub Actions, Jenkins) · Terraform · Observability (Grafana, Kibana, Datadog) · Spring Security / OAuth · Microservices & Containerization · Kafka (Avro, DLQ pattern) · AWS Cloud Architecture · Java / Java EE (Spring Boot, Wildfly) · Stakeholder Communication

Professional Development

- AWS Certified Solutions Architect – Associate — Completed
- LangChain / LangGraph Academy — Completed
- Agentic AI — Johns Hopkins University, In progress
- Professional Certificate in AI & Machine Learning — Completed

Education

- 2004 – 2010 · Information Technology – Software Engineering, Technical University of Budapest

Interests

Sailing, Tennis, Badminton, Startups & Development
