Full-Stack Software Engineer | AI & Cloud

AI Engineer and Java backend lead with **15+ years** in software development, most of it for banks and fintech companies in Switzerland, Germany and the US (UBS, Julius Baer, Verimi, Broadridge). I find out what people actually need first, then build the system that solves it.

AI Engineer: Since 2025 I have built agent systems on LLM APIs (Anthropic Claude, OpenAI, Qwen): RAG, multi-agent orchestration, MCP tool calling and model routing. I have released 5 of them publicly. One of them now does the work a webshop used to pay a marketing employee for. I also work with deep learning, reinforcement learning and model fine-tuning (PyTorch, TensorFlow, scikit-learn).

Solution Architect: **AWS Certified Solutions Architect**. I deploy my own systems on AWS with Terraform and Step Functions. At Julius Baer I ran Azure-hosted Kubernetes clusters in dev and production.

Software Developer at the core: **Java / Java EE (Spring Boot, Wildfly), Oracle / SQL (JPA / Hibernate), Kafka and Gradle**. I work test-first and keep the code readable for whoever maintains it next.

Team Lead: I have led teams of 5 and 6 developers, coordinated delivery across 3 teams, and run Scrum in 2-week sprints. I work directly with customers, business analysts and solution architects to turn requirements into delivered software.

Professional Experience

AI Engineer — Independent Projects

2025 Jul – Present

- Built and publicly released 5 systems on LLM APIs (Anthropic Claude, OpenAI, Qwen on Amazon Bedrock) in Python and TypeScript: job research, bill processing, company reputation management, GEO and crypto indicator tracking.
- Built a competitor-analysis workflow for a webshop that tracks the activities and campaigns of around 5 competitors. A 5-person team uses it, and it took over the work of a dedicated marketing role.
- Built a bill-processing system that reads PDF bills and QR codes and extracts payee, due date and amount from Hungarian and Swiss bills. It runs on AWS (Step Functions, Bedrock), deployed with Terraform and automated pipelines.
- Built RAG pipelines on Pinecone and Chroma and tuned chunking against validated results. Built agent workflows with LangGraph, my own ReAct loop and a custom multi-agent harness, plus MCP servers that give agents tool calling against real APIs and data.
- Made agent outputs reliable with JSON / Pydantic contracts, retries, rate-limit handling and fallback to another model tier. Token counting records the cost of every run in the database and logs, with alerts on top.
- Monitor agents with LangSmith tracing and a Grafana, Prometheus and Loki stack. Use Playwright for browser automation and end-to-end tests. Final actions such as job submissions wait for human approval.
- Use Claude Code and Codex daily as my main coding tools. Published 5+ architecture case studies at feketegabor.com/portfolio.

Lead Developer — Fintama AG

2022 Jun – 2025 Jul | *Customer: Julius Baer*

- Led a team of 5 developers day to day, running stand-ups and syncs, and coordinated progress, priorities and dependencies across 3 teams.
- Owned 5 microservices end to end: handover, solution design, implementation, maintenance and production support.
- Broke 3–6-month projects into epics and sprints, typically delivering on schedule while taking in new requests along the way.
- Designed REST APIs and Kafka Avro event schemas between microservices (Spring Boot, Wildfly). Contributed to the quarterly architecture sessions that defined the bank's API and event contracts and its cross-team data model (DDD).
- Implemented the dead-letter-queue pattern for Kafka. It was then adopted across a 50–60-person area of the bank. Regularly called in as the Kafka specialist for production incidents.
- Moved the team to test-first development (TDD) with JUnit, Mockito and Testcontainers, while keeping the bank's mandatory 80%+ test coverage.
- Ran Azure-hosted Kubernetes clusters in dev and production. Built Docker images and CI/CD pipelines with GitHub Actions, Jenkins, Gradle and Git within the bank's release governance.
- Set up and maintained the team's Grafana dashboards. Found root causes of task-manager failures by tracing Kibana logs by time and task ID.
- Masked personal data (PII) across services and logs to meet the bank's data-protection requirements. Worked with the Hazelcast cache cluster behind an application used worldwide.
- Member of the bank's Technical Excellence group. Built proofs of concept to test high-risk changes before they went into delivery.
- Implemented features in Java, JPA / Hibernate and Oracle SQL, and covered frontend work when the frontend developers were overloaded.

Team Lead — EPAM

2020 Nov – 2021 Oct | *Customer: Broadridge*

- Led a team of 6 developers through 11 months of 2-week sprints. Owned sprint planning, scope, priorities, release management, retrospectives and demos.
- Turned business requirements into specifications together with the customer and business analysts.
- Built a central, real-time distributed configuration management system used by 6 development teams in 3 locations.
- Designed and introduced a global health-check and monitoring framework to detect recurring system issues early.
- Ran code reviews for the team, plus team-fit and technical interviews for new hires.
- Worked with the DevOps engineers on the AWS architecture, infrastructure and deployment.

Key Developer — EPAM

2016 Dec – 2019 Nov | *Customer: Verimi (verimi.de)*

- Led the security and OAuth implementation across ~20 Spring Boot microservices with Spring Security, including custom components in the Spring Security filter chain.
- Built a shared OAuth testing framework that checked security compliance across the services.
- Ran planning sessions with the customer and turned their needs into development work.
- Planned and evaluated a CQRS-based cloud architecture and its Java backend components.
- Owned release management for the microservices platform.

Software Developer — UBS

2010 – 2016

- Built new features and fixed production issues in Java and Spring applications.
- Wrote and tuned Oracle PL/SQL packages, stored procedures, functions and performance-sensitive queries.
- Worked across the full lifecycle: technical design, implementation, testing, deployment and production support.

Education

Technical University of Budapest — MSc (equivalent), Information Technology – Software Engineering 2004 – 2010

Core Skills & Competencies

Generative AI & Machine Learning | Large Language Models (LLMs) | AI Agents & Multi-Agent Orchestration | Retrieval-Augmented Generation (RAG) | LangChain / LangGraph | Model Context Protocol (MCP) | Pinecone / Chroma | Amazon Bedrock | LangSmith | Deep Learning | Reinforcement Learning | PyTorch | TensorFlow | scikit-learn | Foundation Model Fine-Tuning | Predictive Modeling | Data Science | AWS Cloud Architecture | AWS Step Functions | Microsoft Azure (AKS) | AI Solution Design | Java / Java EE (Spring Boot, Wildfly) | Spring Security / OAuth2 | JPA / Hibernate | Oracle & SQL (PL/SQL) | Postgres | MongoDB | Gradle & Git | Testing (JUnit, Mockito, Testcontainers, Playwright) | TDD | Python | TypeScript | Terraform | Microservices & Containerization (Docker) | Kubernetes (K8s) | CI/CD (GitHub Actions, Jenkins) | Kafka (Avro) | JMS | Hazelcast | Observability (Grafana, Prometheus, Loki, Kibana, Datadog) | Bash / Shell Scripting | Domain-Driven Design (DDD) | Scrum / Agile | Technical Leadership | Stakeholder Communication | Banking / Finance | Frontend – React / React Native

Certifications

- AWS Certified Solutions Architect – Associate
- LangChain / LangGraph Academy
- Agentic AI — Johns Hopkins University
- Professional Certificate in AI & Machine Learning

Personal Details & Interests

- Date of Birth: 12.03.1985 | Nationality: Hungarian | Permit: Swiss B | Driving Licence: Yes
- Languages: Hungarian (native) | English (fluent, working language) | German (A1–A2, working towards C1)
- Interests: Sailing, Tennis, Badminton, Startups & Development
